Reviews

Complete guideline for publication fans. I am quite late in start reading this one, but better then never. It is extremely difficult to leave it before concluding, once you begin to read the book.

Contemplation and reflection on the processes in nature suggests that some of the complex systems under certain conditions have the ability of self-organization and evolution. The most remarkable example of this is the life on our planet. The task of understanding the origin of life from a very limited set of chemical elements and molecules in a more or less clear and well-simulated conditions of so-called primordial soup seems to be fairly simple, compared to the task of understanding the structure and functioning of the simplest living organisms. Maybe that's how it is. But, nevertheless, this problem is still far from being solved. Perhaps the point is that, despite the false impression of the sufficient understanding of living organisms, in fact, may be modern biology misses some subtle and very important element of the picture, without which it cannot give a clear answer to the famous question Ervin Schrodinger asked: What Is Life? In his groundbreaking book, Farid Zapparov takes the physicochemical and non-linear laws of nature for the revelation of the emergence of life. He explains how the rheological property of living matter accounts for evolution and how all life forms on Earth are governed by the same principle. The book contains a detailed account of the so-called viscoelastic hypothesis of evolution of living systems put forward by Farid earlier in The Food Delusion (2012). If we evaluate the concept of the author using the criterion of the genius physicist Niels Bohr, on whether his theory is crazy enough to have a chance of being correct? - The answer is undoubtedly yes. The ideas presented in the book are perhaps the most original in the science...
